All

- **Farming System:** Arable crops
- **Farm vulnerability component:** Crop system

- **Description:**

Diverse crop rotation, legumes, no pesticides and mineral fertilizer use

- **Comments on sustainability:**

Organic production has positive effects on biodiversity, soil structure and water quality due to the diverse production system that includes legumes. No pesticides and less nutrients are washed into the ground/surface water (max. 2 Livestock units/ha). The GHG emissions per produced unit are mostly not improved due to the lower yields. After the conversion time, better market prices can be reached. Agricultural advice is recommended.
