Summer

Spring

Summer

- **Farming System:** Livestock

Dairy

- **Farm vulnerability component:**

Animal feeding

- **Description:**

Increase fodder autonomy through diversification, double end crops and other techniques

- **Comments on sustainability:**

Increasing fodder autonomy means decreasing fodder purchase dependency and facing high costs (as in Mediterranean conditions fodder prices raise more than other crops). This can be achieved in several ways: by increasing the number of fodder crops cultivated, by using double-end crops, by producing fodder in rain fed plots (alfalfa) and not only on irrigated land, by improving silage conditions, etc.
